

# CSS Verify Available From Eclipse

August 1, 2000

Eclipse's ImageVerify product can now compare CSS encrypted DVD replicates against the original source tape.

"Until now, CSS encrypted replicates have been inaccessible to verification programs", stated Kevin McDonnell, President of Eclipse. "DVD manufacturers have not had a way to verify the accuracy of the content other than dedicating operators to view the movie."

Eclipse has developed a proprietary technique to decrypt CSS protected DVD replicas and compare them back against the source tape. This method provides closed-loop verification that ensures accuracy of the steps in the encryption process.

ImageVerify does not require custom hardware or peripherals. The verification process uses CSS authentication to unlock the drive, which allows the use of commercially available DVD drives.

Due to the requirements of CSS licensing this product is available only to CSS licensees having a replication license.

Eclipse develops mastering, premastering, and QC verification tools for the CD and DVD manufacturing industry.
