

Eclipse Masters DVD-Audio

February 21, 2001

Eclipse Data announced the release of their new DVD-Audio options for both the EclipseSuite Software and ImageEncoder products at the REPLtech North America Show.

The new DVD-Audio module adds analysis and verification capability to EclipseSuite Software. ImageAnalysis provides the capability to check images prior to mastering to ensure they have been correctly formatted during authoring. ImageVerify provides a bit-to-bit verification of the encrypted DVD-Audio disc to the source image ensuring an exact copy. The ImageEncoder DVD-Audio module adds CPPM encryption capability and can master images to local hard disc drive, network, or direct from DLT.

The EclipseSuite and ImageEncoder modules use a common analysis engine to test images against more than thirty new rules defined in the DVD-Audio specification. They include validating CMF and control data files and keys, the ISO/UDF file structure, hybrid DVD-Audio and DVD-Video file placement, and CPPM and CSS encrypted images.
