

SPECIFICATION – ECLIPSESUITE BD ANALYSIS ENGINE

Protecting Your Process

All EclipseSuite BD programs use the same rules-based analysis engine. More than 150 new rules ensure every title meets the various BD specifications – at every point in the manufacturing process. The EclipseSuite Analysis Engine adheres to the following specifications:

- BD Read-Only – Part 1: Basic Format Specifications Ver.1.3 Nov.2005
- BD Read-Only – Part 2: File System Specifications Ver.1.2 Dec.2005
- BD Read-Only – Part 3: Audio Visual Basic Specifications Ver.2.01 Jan.2007
- Advanced Access Content System (AACs) – Blu-ray Disc Pre-recorded Book Ver. 0.912 July 27, 2006
- Blu-ray ROM Cutting Master Format (BDCMF) Ver. 0.90 20 Oct. 2006

Customizable Test Levels

The EclipseSuite Analysis Engine allows customization of each testing rule. EclipseSuite rule sets can be created and saved for use in different areas of the process, or to be shared with customers – ensuring compatibility. Each rule can be set to one of seven severity levels.

- Ignore – results are not displayed and will not influence final results
- Info – results are display with an info icon and will not influence final results
- Flag – results are displayed with a flag icon and will not influence final results
- Warning – results are displayed with a warning icon and will change final results to ‘Pass With Warning’
- Error – results are displayed with an error icon, final results change to ‘Failed’, and test will continue
- Abort - results are displayed with an error icon, final results change to ‘Failed’, and test will stop immediately

AACS Support – Encryption and Decryption

The AACs encryption process starts at authoring and is completed in the replication plant mastering process. The EclipseSuite analysis engine uses specific test rules to ensure that the image is authored correctly for encryption. Once encrypted, any further analysis and verification securely decrypts the data automatically, validating the encryption and image contents.

Program	Encryption	Decryption
ImageAnalysis	No	Yes
ImageCopy	Yes	Yes ¹
ImageVerify	No	Yes

1 - Used for Verify-After-Copy

EclipseSuite AACs Encryption and Decryption

ImageSignature Tracking and Verification

The EclipseSuite BD Analysis Engine automatically calculates an ImageSignature and checksums during every analysis. Checksums ensure that all files associated with the title are accurately transferred from one process step to the next. Separate and different from checksums which protect every bit of every file, ImageSignature is highly-reliable mathematical representation of the user data and certain key information. Therefore, it can be used for identifying and verifying the image throughout the process – the Analysis Engine can calculate the same signature from a title as it moves from authoring as a CMF file, through encryption, and Final QC as a replica.
